

# Salt River Public Works Water System

## 2022 WATER QUALITY REPORT

### WELCOME MESSAGE

The Salt River Pima-Maricopa Indian Community Public Works Department is pleased to provide you with the 2022 Consumer Confidence Report (CCR) for the Salt River Public Works Water System No. 090400109. This CCR, also known as a Water Quality Report, summarizes the results of tests and measurements performed at the SRPMIC water production facilities and throughout the water distribution system for the 2022 calendar year. These tests and measurements ensure that we deliver the highest quality of water to you. In reading the report, you will discover that your tap water met or surpassed all federal drinking water health standards as set by the Environmental Protection Agency. The Public Works Department is committed to providing the highest quality drinking water and in ensuring that the Community has adequate water sources to meet its current and future needs. We encourage you to read the report to learn more about the water delivered to your home. We value your trust in our ability to provide high quality water service. Thank you for allowing us the opportunity to serve you.

Sincerely,  
Public Works Department  
Salt River Pima-Maricopa Indian Community

### PROJECTS WITHIN YOUR WATER SYSTEM

As the Community continues to grow, the SRPMIC Public Works Department, with support from SRPMIC Council, makes it a priority to continually work to improve your water infrastructure and facilities. This year (2023), we installed a new water main on McDonald Drive between the 101 to May St and are replacing aging water mains in the Dobson Heights Subdivision. In 2024, we will replace water mains on Alma School Rd and in the Victory Acres I subdivision.

### WHERE DOES OUR WATER COME FROM?

Your water comes from three (3) ground water sources. Five additional ground water sources are supplied from Public Water System No. 090400703 through a consecutive connection.

### PROTECTING OUR LOCAL WATER SOURCES

The EPA conducted a sanitary survey for the water production facilities in 2022. During the survey, there was no deficiency that present a serious health risk. Next sanitary survey is scheduled for March 2027. The Public Works Department ensures the safety of your drinking water by continuously monitoring the treated water as required by drinking water regulations.

### ARE THERE CONTAMINANTS IN OUR DRINKING WATER?

To ensure the tap water is safe to drink, the EPA prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risks. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals, in some cases, radioactive material, and substances results from the presence of animals or from human activity. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may be from wastewater treatment plants, septic systems, agricultural livestock operations, or wildlife;
- Inorganic contaminants, such as salts and metals, that can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, that may come from a variety of sources such as agriculture, urban storm water runoff and residential uses;
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes, petroleum production, and can also come from gas stations, urban storm water runoff, septic systems; and
- Radioactive contaminants that can be naturally occurring or can be the result of oil and gas production and mining activities. The presence of contaminants does not necessarily indicate that water poses a health risk.

More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

As the Federal regulations require, we routinely test your drinking water for numerous contaminants. These contaminants include total coliform, inorganic compounds, nitrate, nitrite, lead and copper, volatile organic compounds, total trihalomethanes (TTHMs), haloacetic acids (HAA5), radiological, and synthetic organic compounds.

2022 SRPMIC - Water Quality Data								
The table presented below depicts which compounds were detected in your drinking water. The EPA allows us to test for some contaminants less frequently because the concentrations of these contaminants do not change. Some of our data, though representative, are more than one year old.								
Analyte	Violation Yes / No	Sample Date	Your Water	Range		MRDLG	MRDL	Typical Source
				Low	High			
Disinfectants:								
Chlorine, Chlorine Residual Units: ppm	No	2022	1.1146	0.5	1.58	4	4	Drinking water additive used for disinfection
Analyte	Violation Yes / No	Sample Date	Your Water	Range		MCLG	MCL	Typical Source
				Low	High			
Disinfection By-Products:								
Total Trihalomethanes (TTHMs) Units: ppb	No	2022	48.3	7	48.3	N/A	80	By-product of drinking water chlorination
Inorganic:								
Arsenic Units: ppb	No	2022	2.7	ND	2.7	0	10	Erosion of natural deposits; runoff from orchards; glass and electronics production wastes
Barium Units: ppm	No	2019-2022	0.012	ND	0.012	2	2	Discharge of oil drilling wastes and from metal refineries; erosion of natural deposits
Chromium Units: ppb	No	2022	24	7.5	24	100	100	Discharge from steel and pulp mills and chrome plating; erosion of natural deposits
Fluoride Units: ppm	No	2019-2022	1.63	0.57	1.63	4	4	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories
Nitrate (reported as Nitrogen) Units: ppm	No	2022	5.18	1.26	5.18	10	10	Runoff and leaching from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Selenium Units: ppb	No	2019-2022	4.1	2.0	4.1	50	50	Petroleum, glass, metal refineries; erosion of natural deposits; discharge from mines and chemical manufacturers; livestock lot runoff
Sodium Units: ppm	No	2020-2022	160	140	160	N/A	N/A	Erosion of natural deposits; salt water intrusion
Radiological Contaminants:								
Uranium (combined) Units: ppb	No	2018-2022	4.3	1.1	4.3	0	30	Erosion of natural deposits
Analyte	Violation Yes / No	Sample Date	Your Water	Range		MCLG	Action Level	Typical Source
Lead and Copper Rule:								
Copper Units: ppm 90 <sup>th</sup> Percentile	No	2021	0.308	0 sites over Action Level		1.3	1.3	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives

## Microbiological Testing

We are required to test your water regularly for signs of microbial contamination. Positive test results could lead to follow-up investigations called assessments and potentially the issuance of public health advisories. Assessments could lead to required corrective actions. The information below summarizes the results of those tests.

Calendar Year	Sampling Requirements	Sampling Conducted (months)	Total E. Coli Positive	Assessment Triggers	Assessments Conducted
2022	20 Samples due monthly	12 out of 12	2	1	1

During the year 2022, one Level 2 Assessment was required to be completed for our water system. One Level 2 Assessment was completed. In addition, we were required to take 0 corrective action and we completed 0 of these action.

A Level 2 Assessment is a very detailed study of the water system to identify potential problems and determine (if possible) why an E. coli MCL violation has occurred and /or why total coliform bacteria have been found in our system on multiple occasions. E. coli are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Human pathogens in these wastes can cause short-term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a greater health risk for infants, young children, the elderly, and people with severely compromised immune systems. We found E. coli bacteria, indicating the need to look for potential problems in water treatment or distribution. When this occurs, we are required to conduct assessment(s) to identify problems and to correct any problems that were found during these assessments.

Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful, waterborne pathogens may be present or that a potential pathway exists through which contamination may enter the drinking water distribution system. We found coliforms indicating the need to look for potential problems in water treatment or distribution. When this occurs, we are required to conduct assessment(s) to identify problems and to correct any problems that were found during these assessments.

## Health-Based Violations

The table below lists the health-based violations the water system incurred during the last calendar year. While you should have received notification of the violations at an earlier date, we are required to list them in this report.

Contaminant Name	Type of Violation	Begin/End Date	Step Taken to Correct the Violation	Return to Compliance	Return Date	Action Comment
Revised Total Coliform Rule (RTCR)	Confirmed Maximum Contaminant Level violation for fecal coliforms	10/1/2022 – 10/31/2022	Following month reporting of all required results that meet all MCLs.	Yes	10/12/2022	Subsequent reporting of required results

What should I do, as a consumer?

There is nothing you need to do at this time.

What is being done by the utility?

We have worked with our regulatory official to conduct all required contaminant monitoring as directed.

## KEY WATER QUALITY TERMS

The following are definitions of key terms referring to standards and goals of water quality noted on the data table.

(MCL): Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

(MCLG): Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.

90<sup>th</sup> Percentile: Statistical value used to determine if Action Level is exceeded. Determined by calculating the value at which 90% of the samples tested were below that value.

Action Level (AL): The concentration of a contaminant which, if exceeded, trigger treatment or other requirements which a water system must follow.

Not-Detects (ND): Laboratory analysis indicates that the constituent is no present.

Not Applicable (N/A): Does not apply to.

Parts per million (ppm): Corresponds to one part of liquid in one million parts of liquid.

Parts per billion (ppb): Corresponds to one part of liquid in one billion parts of liquid.

Positive Samples: The number of positive samples taken that year.

% positive samples/month: % of samples taken monthly that were positive.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

## WHAT DOES THIS INFORMATION MEAN?

As you can see by the table, our system had no violations in 2022. We have learned through our testing that some contaminants have been detected; however, these contaminants were detected below the level allowed by the EPA.

## IS OUR WATER SYSTEM MEETING OTHER RULES THAT GOVERN OPERATIONS?

During 2022, our system was in compliance with applicable Federal drinking water operating, monitoring and reporting requirements.

## DO I NEED TO TAKE SPECIAL PRECAUTIONS?

Although our drinking water met or exceeded federal regulations, some people may be more vulnerable to disease causing microorganisms or pathogens in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice from their health care provider about their drinking water. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium*, *Giardia* and other microbial pathogens are available from the Safe Drinking Water Hotline (800-426-4791).

## DRINKING WATER AND LEAD

Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. It is possible that lead levels at your home in the community may be higher than at others because of plumbing materials used in your property. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Infants and young children are typically more vulnerable to lead in drinking water than the general population. You can minimize the potential for lead exposure, when your water has been sitting for several hours, by flushing your tap for 30 seconds to 2 minutes (or until the water temperature has changed) before using water for drinking or cooking. If you are concerned about lead levels in your water, you may wish to have your water tested. Additional information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the USEPA's Safe Drinking Water Hotline 800-426-4791, or at <https://www.epa.gov/ground-water-and-drinking-water/basic-information-about-lead-drinking-water>.

## WHY SAVE WATER AND HOW TO AVOID WASTING IT?

Although our system has an adequate amount of water to meet present and future demands, there are a number of reasons why it is important to conserve water:

- Saving water reduces the cost of energy required to pump water.
- Saving water lessens the strain on the water system during a dry spell or drought.

You can play a role in conserving water by becoming conscious of the amount of water your household is using, and by looking for ways to use less whenever you can. Conservation tips include:

- Check every faucet in your home for leaks. Just a slow drip can waste 15 to 20 gallons a day. Fix it and you can save almost 6,000 gallons per year.
- Check your toilets for leaks by putting a few drops of food coloring in the tank, watch for a few minutes to see if the color shows up in the bowl. It is not uncommon to lose up to 100 gallons a day from one of these otherwise invisible toilet leaks. Fix it and you can save more than 30,000 gallons a year.

## WHERE TO LEARN ABOUT THE QUALITY OF OUR WATER

Please feel free to contact the number provided below for a translated copy of the report if you need it in another language.

For more information or to request a printed copy of this report, please contact Public Works Department at 480-362-5600, Monday - Friday 8AM - 5PM.

You can also mail your questions to:

Salt River Pima-Maricopa  
Indian Community  
Public Works Department  
10005 East Osborn Road

You may also call the EPA's Safe Drinking Water Hotline  
For Information about the Safe Drinking Water Act or  
EPA's other drinking water programs at 800-426-4791.
